

PURPOSE: To change wellness, sign-out cards, seminars, and work service cards to a mobile app.

INTRODUCED BY: Teddy Lai

BE IT RESOLVED BY THE MISSISSIPPI SCHOOL FOR MATHEMATICS AND SCIENCE SENATE:

SECTION ONE (REASONING):

The current system of using cards or paper to sign in or out of things can be very tedious and may be inconvenient at times. Things such as processing privilege plans require staff to go over every student's work service, wellness hours, and number of seminars individually. This is a very tedious process and has resulted in privilege plans being delayed for multiple weeks. If a mobile app was created getting your privilege plan could be as easy as you meeting a certain variable and the system automatically giving your privilege plans without delay.

After you have been assigned your privilege plans you will get a set amount of days to have tutorial hours off. You no longer must select which days of the week you want off but instead you get a certain number of days that you cannot go over.

This mobile app should also make it more convenient to sign out for wellness. Instead of having to walk all the way back to Frazer or Goen to sign out for wellness now you can do it anywhere.

Some may display concerns about faking things such as work service or wellness. However, many students already fake their wellness and work service by simply forging signatures for wellness or simply signing in and out multiple times on the last day for work service. With an app you would only be allowed to sign the day of doing your work service. **Permission from an RA or staff member would still be required. The app will not use location tracking services.**

SECTION TWO (PROPOSED ACTION):

Students know this system very well and thus should work on it themselves to create this app. If the app design class receives enough requests, then next year the app design class can lead the creation of this app.

If the app design class does not receive enough course requests, then the computer science club that was not created this year can hopefully be formed to take over this project **or an existing app/service can also be used.**
